Description

Melanostatin DM is an inhibitor of α -melanocyte stimulating hormone (α -MSH), which is the primary hormone that controls production of melanin pigment. By inhibiting the effects of α -MSH, Melanostatin DM is able to lighten skin tone and even out skin coloration in laboratory experiments. It may be useful for the treatment of photodamage (skin discoloration due to sun exposure) as well as other conditions in which melanin production needs to be reduced.

Application&Function

Melanostatin DM is being actively invested in animal and in vitro models for its ability to interfere with melanin production. The molecule is thought to interfere with tyrosinase activity by inhibiting the actions of α -MSH. It may be useful in the treatment of disease that cause skin discoloration, such as disease and diabetes.
