#### Description

Acetyl Hexapeptide 38 (Breast Enlargement Peptide) is an acetylated hexapeptide that can significantly stimulate fat synthesis at the site of use, increase breast or cheek volume, and create a perfect body. The Chemicalbook experiment on preadipocyte culture showed that after 10 days, 0.5mg/ml of acetyl hexapeptide 38 (thymopeptide) induced a 61.1% increase in the expression of PGC-1 $\alpha$  and a 32.4% increase in fat accumulation.

#### Application&Function

1. Acetyl Hexapeptide-38 increases the volume of adipose tissue in specific areas, improving facial appearance and providing attractive body contours.
2. Acetyl Hexapeptide-38 stimulates the expression of the peroxisome proliferator-activated receptor Gamma coactivator 1 $\alpha$  (PGC-1 $\alpha$ ), which increases the rate of adipogenesis. This leads to higher lipid accumulation and volume growth in desired areas such as the breasts and cheeks.
